

All CSR databases are presently set to operate on XP, Vista and Windows 7. To save pictures in any of our databases that are operating on Windows 7, a user first needs to have a full copy of Access 2007. Next is to either move the database to a trusted location or tell Access 2007 that the location the database is in is a trusted location. The following information is directly from Microsoft Access 2007 support.

Access 2007 opens all legacy databases in Disabled mode and keeps them in that state. You can choose to enable disabled content by placing the database in a trusted location.

Start the Trust Center

1. Click the **Microsoft Office Button**  , and then click **Access Options**.

NOTE You do not need to open a database.

The **Access Options** dialog box appears.

1. Click **Trust Center**, and under **Microsoft Office Access Trust Center**, click **Trust Center Settings**.
2. Click **Trusted Locations**, and then do one of the following:

Note the path of one or more trusted locations.

Create a new trusted location. To do so, click **Add new location**, and then complete the options in the **Microsoft Office Trusted Location** dialog box.

For more information about creating a trusted location, see the article [Create, remove, or change a trusted location for your files](#).

Place a database in a trusted location

Use your favorite technique for moving or copying a database file to a trusted location. For example, you can use Windows Explorer to copy or move the file, or you can open the file in Access and save it to the trusted location.

Open a database in a trusted location

Use your favorite technique for opening a file. For example, you can locate and double-click the file in Windows Explorer, or, if Access is running, you can click the **Microsoft Office Button**  to locate and open the file.
